DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1 to 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Arst (3,359,077).

The Arst reference teaches an apparatus for crystal growth by the czochralski method, note entire reference. The apparatus consists of a chamber, which surrounds the crucible. There is a crucible for containing a melt. The crucible is surrounded by a heater, which is capable of melting materials. There is a bar, which is lowered and raised with a seed. The bar creates the single crystal. There is a thermal insulating wall surrounding the heater with a cover plate. There is a hole in the plate to allow for

the bar and crystal to pass, note figure 1. The apparatus is capable of growing metal fluoride crystals. The sole difference between the instant claims and the prior art is the material of the cover plate and thermal conductivity of the plate. It would have been obvious to one of ordinary skill in the art to determine through routine experimentation the optimum, operable cover plate materials and properties in the Arst reference in order to create uniform temperature gradients in the area above the crucible which creates a more uniform crystal.
